CROWDSTRIKE + SALT

Partnering to deliver full visibility into the API-focused attack surface alongside auditing, attack detection and blocking
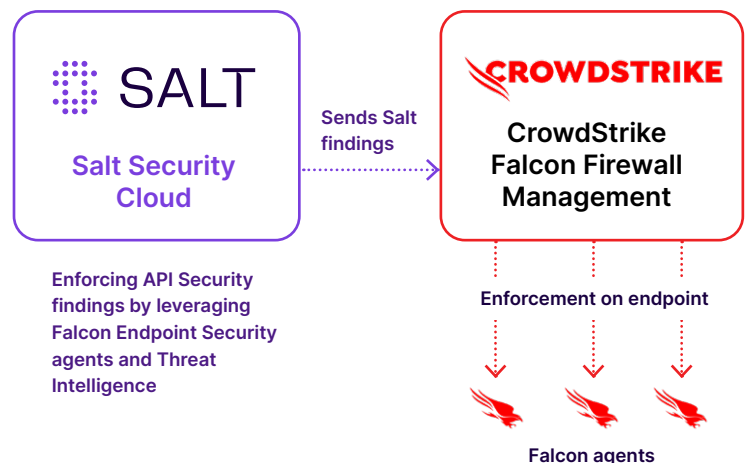

Protecting against API threats requires deep visibility and robust runtime protection. By integrating the Salt Security API Protection Platform with the CrowdStrike Falcon® Platform, customers can now get a 360-degree view of API security risks and unique insights into the application-layer attack surface. Available on the CrowdStrike Marketplace, the new integration delivers robust API threat intelligence and enhanced cross-organization API security functions by streamlining and improving API auditing, monitoring, and enforcement workflows.

Only the patented Salt API security platform applies cloud-scale big data, along with artificial intelligence (AI) and machine learning (ML), to enable organizations to automatically discover and inventory all of their APIs. By showing where APIs expose sensitive data, Salt helps enterprises identify and block potential API attacks, as well as remediate vulnerabilities to strengthen their API security posture.

The combination of best-of-breed API runtime monitoring and AI-driven insights from Salt with robust endpoint and workload protection capabilities from CrowdStrike's award-winning AI-powered protection capabilities gives organizations complete visibility into their API attack surface with context into the business criticality of threats.

Key capabilities

- **API vulnerability and threat context:** Additional intelligence from the Salt platform provides contextual information on API vulnerabilities and threats for application-layer security which enriches the Falcon platform

- **API threat mitigation:** Robust API threat mitigation with Salt detections integrated with the Falcon platform

- **API threat management automation:** Enhanced detection, investigation and response of API-based threats through automated policy management within the Falcon console
